

REAL-TIME AI VOICE FORENSICS

Trust every voice that touches your bank.

VoxShield detects AI-cloned and synthetic voices in real time, verifies liveness, and scores fraud risk, a **layered, honest defence** for India's voice-first banking and enterprise channels.

Flags a fraud call

10

Indian languages, fair

5-Model Detection

Five decorrelated detectors fused by a learned meta-stacker into one calibrated, honest score.

Language Fairness

Measured across 10 Indian languages and telephony, so genuine callers are not misread as fraud.

Liveness Challenge

A random spoken-digit prompt a recording cannot answer. Content, liveness and timing checked at once.

Explainable Verdicts

Plain-language reason codes on every decision, an operator, auditor and regulator can each read.

On-Prem & Air-Gapped

Docker image bakes every model in. Runs in the bank's own data centre with zero external calls.

Never Auto-Block

A layered fraud signal, not a judge. High risk routes to step-up verification, a human stays in charge.

DETECTION · FAIRNESS · LIVENESS

WHY VOXSHIELD

Fusion, not a single model

Five detectors decorrelate errors; one learned stacker cuts error 3× over the best model alone.

Fair for India

False-positives on genuine Indian speech cut 36.3% → 11.7% with published per-language rates.

Beats replay attacks

Challenge-response liveness closes the door pure detection cannot: a recording can't answer live.

Audit-ready by design

SHA-256 ledger, reason codes and step-up routing. Explainable to operator, auditor and regulator.
